
StudySpot Gaza

A Smart Study Space Finder for Gaza University Students

Sprint 1 Proposal • Software Engineering Course • April 2026

1. Project Overview

Project Name: StudySpot Gaza

University: Islamic University of Gaza

Department: Computer Engineering

Platform: Mobile Application (Flutter)

Course: Software Engineering

Sprint: 1 – Idea & Proposal

Date: April 2026

2. Project Idea

StudySpot Gaza is a Flutter-based mobile application designed for students in the Gaza Strip. The app helps students discover and navigate to available study and workspace locations — both free and paid — based on their current geographic location.

Each listed hub displays essential information such as operating hours, pricing (if applicable), internet connectivity strength, electricity availability, and other available services.

Given the limited project timeline, the initial release will focus on a curated set of verified study hubs with GPS/map integration to show students the nearest available options.

3. Problem Statement

Students in Gaza face several interconnected challenges when trying to find a suitable place to study:

- Severe and unpredictable electricity outages make it difficult to study at home.
- A large number of students have been displaced from their homes, leaving them without a stable study environment.
- There is no centralized platform listing available study spaces with details such as electricity status and internet quality.
- Engineering and technical students require consistent power and connectivity for labs and project work.
- First-year students are unfamiliar with the available study venues around their campus or city.

4. Target Users & Use Cases

Primary Users

- University students across Gaza, especially engineering students with high resource demands.
- School students seeking a quiet and reliable environment to study or complete assignments.
- Displaced students seeking stable environments during exam seasons.
- First-year students unfamiliar with local study spots.

Use Cases

- A student checks the app before leaving home to find the closest open hub with electricity.
- A student filters by price to find a free study space near their current location.
- A school student looks for a nearby quiet space with good internet to finish homework.
- A student navigates to a nearby hub using the integrated map view.

5. Core Features

Feature	Description
Study Hub Listings	Browse a curated list of study/work spaces with key details (hours, price, services).
Real-Time Hub Info	View electricity availability, internet quality, and pricing for each location.
GPS & Map Integration	See nearby hubs on an interactive map and get directions.
Search & Filter	Filter hubs by price, distance, services, or availability.
Hub Detail Page	Full profile of each location with contact info and user ratings.

6. Comparison with Existing Solutions

There is currently no known application serving Gaza students with this specific functionality. General solutions like Google Maps can show nearby cafes or libraries, but they do not provide Gaza-specific data about electricity availability, internet quality, or student-oriented pricing. StudySpot Gaza fills this gap by offering a locally tailored, student-focused solution that accounts for the unique infrastructure challenges of the region.

7. Expected Impact & Benefit

- Reduces the time and effort students spend searching for a suitable study environment.
- Improves academic performance by ensuring students can access reliable study conditions, especially during exams.
- Supports displaced and first-year students by making local resources more accessible.
- Encourages study hub owners to improve their services through visibility and student feedback.

8. Technology & Tools

At this stage, the team has confirmed the use of Flutter for mobile development. All other tools and technologies are still under evaluation and will be finalized in upcoming sprints.

Layer	Technology
Mobile Framework	Flutter (Dart)
Backend / Database	To be determined
Maps & GPS	To be determined
Other Tools	To be determined

9. Future Development

The following features are planned for future development phases once the core app is stable and time permits:

- AI-Powered Assistant – An intelligent chatbot that recommends the most suitable study hub based on the student's needs, location, and preferences.
- Community Hub Submissions – Allow students to suggest and rate new study spaces.
- Real-Time Updates – Live status updates for electricity and internet availability contributed by the community.
- Notifications – Alert students when a preferred hub becomes available or opens.

10. Project Team

#	Student Name	Student ID
1	ساجدة ياسر عبد العزيز أبو عنزة	220212991
2	شذى علي عبد أبو طير	220210499
3	آية أحمد أبو إسماعيل	220220335
4	ايمان رشاد محمد البطش	220211835
5	مرح احمد علي الجبالي	220210525
6	تسنيم صبحي أحمد الصادي	220210489
7	غيداء أسامة حسين راضي	220210618
8	تسنيم رامي حسن قنوع	220210639

Scope Note (Sprint 1)

Given the limited time remaining in the term, the team will focus on delivering a functional core: a small number of manually added study hubs with GPS/map integration and basic filtering. Full community-driven hub submissions and advanced features are deferred to future sprints.
